# Strategic Sophistication: An Experimental Test 

Sotiris Georganas (OSU)<br>P.J. Healy (OSU)<br>Roberto Weber (CMU)

April 22nd, 2009<br>Harvard Business School

## Two Warnings

(1) Very much a work in progress

- Feedback appreciated encouraged
(2) Potentially boring background information

## Elevator Pitch

(1) Deeper exploration of the 'Level- $k$ ' model
(2) Use a novel game to identify levels
(3) Make 'small' changes to the game to see how levels change
(4) Find: stable for game changes, not for new types of games
(5) Rules of thumb, but not best-response levels
(6) Takeaway: Call for '2nd-generation' model

## Origin of this Paper

Tucson, Arizona
October 20, 2007

## Behavioral Game Theory

- Goal: descriptive model of play in games
- Experiments $\Rightarrow$ Nash equilibrium fails
- But wait... do we care?
"...it is crucial that the social scientist recognize that game theory is not descriptive, but rather (conditionally) normative. It states neither how people do behave nor how they should behave in an absolute sense, but how they should behave if they wish to achieve certain ends."
"Every indication now is that... the game model will have to be made more complicated if experimental data are to be handled adequately."
-Luce \& Raiffa 1957

## Changing The Game

On the Failure of Nash Equilibrium
(1) Learning

- Theory: Evolutionary, reinforcement, belief, hybrid (EWA), imitation...
- Evidence: Horse races, statistical biases, overfitting?
(2) Other-Regarding Preferences
- Evidence: Dictator, ultimatum, PD, public goods games
- Theory: Altruism, warm-glow, inequality-aversion, intentions-based models...
(3) One-Shot Play of 'Well-Specified' Games
- Theory: QRE or Cognitive Hierarchy
- Evidence: Mixed?

## QRE vs. Cognitive Hierarchy

|  | Accurate <br> Beliefs | Best <br> Response |
| ---: | :---: | :---: |
| Nash Equilibrium | $\checkmark$ | $\checkmark$ |
| Nash Equilibrium + Noise | $\checkmark^{*}$ | $\checkmark^{*}$ |
| QRE | $\checkmark$ | X |
| Cognitive Hierarchy | X | $\checkmark$ |
| HQRE | X | X |

## Quantal Response Equilibrium (QRE)

McKelvey \& Palfrey 1995

- All players play a mixed strategy $\sigma_{i}$ with full support
- Logit version:

$$
\sigma_{i}\left(a_{j}\right)=\frac{\exp \left(\lambda E u_{i}\left(a_{j}, \sigma_{-i}\right)\right)}{\sum_{k} \exp \left(\lambda E u\left(a_{k}, \sigma_{-i}\right)\right)}
$$

- Higher-payoff mistakes are more likely
- $\lambda \rightarrow \infty \Rightarrow$ Nash equilibrium
- Consistent beliefs, but not best response.

## Cognitive Hierarchy/Level-k

Basic Version:

- Level 0 plays uniformly
- Or: focal strategy, mix over undominated strategies,...
- May or may not exist
- For all $k \in\{1,2, \ldots\}$, Level $k$ best responds to Level $k-1$.

Level $k$ : Estimate frequencies of each level Cog. Hi.: Level distribution is Poisson, estimate $\lambda$

- Other types might be thrown in...
- Nash type
- Sophisticated type
- Altruist type
- Whatever-Fits-The-Data type :)

## Nagel 1995 AER

Beauty contest game: $n>2$ players pick $x_{i} \in[0,100]$. Winner is closest to $p * \sum_{i} x_{i} / n$ (typically $p<1$ ).

- Level $k: 50 p^{k}$
- For $p=1 / 2:\{50,25,12.5,6.25, \ldots\} \rightarrow 0$

## Stahl \& Wilson 1995 GEB

- 48 subjects play twelve $3 \times 3$ games
- No feedback, can 'go back through' the games
- Estimate 1 type/person

| Type | Number |
| ---: | ---: |
| Level 0 | 6 |
| Level 1 | 9 |
| Level 2 | 1 |
| Nash | 5 |
| Worldly | 17 |
| Unclassified | 10 |

- $44 / 48$ subjs have likelihood ratio $>2.4$

## Camerer, Ho \& Chong 2004 QJE

Proposes Cog.Hi. w/ Poisson specification

| subject pool or game | source ${ }^{1}$ | $\begin{aligned} & \text { group } \\ & \text { size } \\ & \hline \end{aligned}$ | data |  |  | fit of CH model |  |  |  |  |

## The Crawford Papers

- Costa-Gomes, Crawford \& Broseta 2001 Emtca
- 18 normal-form games w/ lookups (9 types!!)
- Costa-Gomes \& Crawford 2006 AER
- 2-person guessing games w/ lookups
- Crawford \& Iriberri 2007 Emtca
- auctions
- Crawford \& Iriberri 2007 AER
- hide-and-seek games
- Crawford, Kugler, Neeman \& Pauzner 2009 JEEA
- mechanism design example
- Costa-Gomes, Crawford \& Iriberri 2009 JEEA
- analysis of old coordination game data

## Back to Tucson...

Tucson, Arizona
October 20, 2007

## Generality vs. Usefulness

(1) Level- $k$ is at least as good as QRE and NE
(2) Estimating dist'n of types vs. Poisson specification
(3) Most action is on L1, L2, and maybe L3. (Ignore dominance.)
(4) Model needs to be adapted to the setting

- L0 may be uniform, focal, anti-focal,...
"The applications illustrate the generality of the level- $k$ approach and the kinds of adaptations needed to use it in different settings."
-Crawford, Oct 20, 2007

## Crawford \& Iriberri 2007 AER

Hide-and-Seek:

| A | B | A | A |
| :--- | :--- | :--- | :--- |

## Crawford \& Iriberri 2007 AER

Hide-and-Seek:

|  | A | B | A | A |
| ---: | :---: | :---: | :---: | :---: |
| Hiders: | $16 \%$ | $18 \%$ | $44 \%$ | $22 \%$ |
| Seekers: | $16 \%$ | $19 \%$ | $54 \%$ | $11 \%$ |

- Hiders found $32.2 \%$ of the time! Overthinking it??
- Level-k story:
(1) Suppose L0 favors B and 'outside' A's...
(2) L1: Hide at central A, Seek away from central A
(3) L2: Hide at central A, Seek at central A
(4) L3: Hide away from central A, Seek at central A
- Result: Lot of action at central A, more hiders than seekers.
- But... other models fit better. Non-focal LO does better.

## Our Reactions

(1) Lack of portability $\Rightarrow$ low predictive power

- Too slippery... the model is supposed to bend
- Maybe it's not supposed to be predictive...
(2) The underlying cognitive model must be too simple...

## The Cognitive Model

- What is the underlying invariant 'type' of a subject?
- Not really made explicit
- Clearly not meant to be an as-if model
- Strict interpretation: type = level
- Our interpretation:
- invariant type $=$ 'strategic sophistication'
- level $=f($ type,game $)$
- f(type,game) may not equal f(type,game')
- 'game' may even include identities or properties of opponents
- type $_{i}>$ type $_{j} \Rightarrow$ level $_{i}>$ level $_{j}$ for all games
- Strict interpretation $\subset$ Our interpretation

## Our Interpretation

- Hypotheses:
(1) Uniform shifts in levels between games
(2) Able to 'measure' a type with diagnostic tests
(3) Correlation between measured types and observed levels

4 (Weakly) higher-level play against higher-type opponents

- NON-Hypotheses:
(1) Stable levels between games
(2) Stable levels across different opponents

## Experiment Design Desiderata

A good experiment should use:
(1) Quizzes believed to diagnose 'strategic sophistication'
(2) Several 'one-shot' games

- Multiple games with revision + no feedback
(3) Symmetric games
(4) No room for other-regarding preferences
- Cost of being nice $\geq$ benefit to others
- Zero-sum game, e.g.
- Framing?
(5) Unique action for each 'level' \{L1,L2,L3,Nash \}
- But not too complicated!
(6) Ability to play against opponents of different types
- Use quiz scores as a proxy

## The Quizzes

(1) IQ test questions
(2) 'Eye Gaze' test
(3) Working Memory test
(4) Cognitive Reflection Test (CRT)
(5) One-Player Takeover game

## IQ Test

- Controversial but possibly relevant
- Some correlations with success, income, patience, etc.
- Taken from Mensa exam

Examples:
(1) If 2 typists can type 2 pages in 2 minutes, how many typists will it take to type 18 pages in 6 minutes?
(2) Unscramble the following word: H C PRAATEU
(3) What number is missing from this pattern: 1827 ? 125216

## Eye Gaze Test

$\square$ jealous $\square$ panicked $\square$ arrogant $\square$ hateful

$\square$ aghast $\square$ fantasizing
$\square$ impatient
$\square$ alarmed

## Eye Gaze Test

- Developed by Simon Baron-Cohen
- Used to identify failures of theory-of-mind
- Diagnostic of adult autism/Asperger's Syndrome
- Higher level $\Leftrightarrow$ better-developed theory of mind?
- Bruguier, Quartz \& Bossaerts 2008
- Higher score $\Rightarrow$ can identify insider traders from prices
- (ToM areas of the brain light up when watching trades)

## Working Memory Test

Movie3 Movie4 Movie5 Movie6 Movie7 Movie8 Movie9

- Wechsler digit span test (Walsch \& Betz 1990)
- Devetag \& Warglien working paper
- Dom. solvable game, dirty faces game, centipede-like game
- Play against 'rational' computer opponent (Nash)
- Total score on games correlates with working memory

## Cognitive Reflection Test

(1) A bat and a ball cost $\$ 1.10$. The bat costs $\$ 1.00$ more than the ball. How much does the ball cost?
(2) If it takes 5 machines 5 minutes to make 5 widgets, how long would it take 100 machines to make 100 widgets?
(3) A patch of lily pads doubles in size each day. If it takes 48 days to cover the lake, how many days would it take to cover half the lake?

## CRT

Shane Frederick survey 2005

- Correlates with time preference
- Correlates with risk taking in gains...
- but risk aversion in losses
- Weak correlation with IQ measures
- Men score higher than women, controlling for SAT

## One-Player Takeover Game

(1) You are bidding to buy a company. To the seller it is worth $X \in\{\$ 0, \$ 30, \$ 60, \$ 90, \$ 120\}$, each with equal probability. The seller knows $X$ but you do not. You are the only bidder and the company is worth $1.5 X$ to you. The seller will only sell if you bid more than $X$. How much should you bid?

- Samuelson \& Bazerman 1985
- Ball, Bazerman \& Carroll 1990 OBHDP

## Our New Game

"The undercutting game" (UG)

- Discrete version of beauty contest-type games
- 'Nearly' zero-sum
- 4 'serious' actions, one for each level
- 3 dominated actions

Variations
UG1: Baseline (7 actions)
UG2: Add 2 dominated actions (9 actions)
UG3: Add 2 'serious' actions (9 actions)
UG4: Compressed UG2 (7 actions)

## Undercutting Game 1

|  | 1 | 2 | 3 | 4 | 5 | 6 | 7 |

UG2 with 3 dominated strategies 'compressed' into 1

## Different Opponents

In each game subjects submit:
(1) Choice vs. randomly-matched opponent
(2) Choice vs. highest-scoring subject on quiz (other than self)
(3) Choice vs. lowest-scoring subject on quiz (other than self)

4 games, 3 choices per game.
2 choices randomly chosen for payment.

## Results

## Aggregate level distributions

## Action Distributions

Versus Random Opponent:

## Level Distributions

## Versus Random Opponent:

## Level Distributions

## Level Distribution vs. CGC06

Our Data

Costa-Gomes \& Crawford 2006

## Results

## Level-switching

## Level Switching: Aggregate

Occurrences of level-switching between games:

| From $\downarrow$ To $\rightarrow$ | Dom. | L1 | L2 | L3 | L4+ |
| ---: | ---: | ---: | ---: | ---: | ---: |
| Dom. | 30 | 22 | 12 | 10 | 19 |
| L1 | 22 | $\mathbf{3 5 2}$ | 88 | 25 | 74 |
| L2 | 12 | 88 | $\mathbf{2 6 4}$ | 39 | 32 |
| L3 | 10 | 25 | 39 | 26 | 32 |
| L4+ | 19 | 74 | 32 | 32 | $\mathbf{3 0 2}$ |

L1, L2, Nash are persistent. L3 \& Dominated are not.

## Level Switching: Aggregate

Markov Transition Matrix:

| From $\downarrow$ To $\rightarrow$ | Dom. | L1 | L 2 | L 3 | $\mathrm{~L} 4+$ |
| ---: | ---: | ---: | ---: | ---: | ---: |
| Dom. | $32.3 \%$ | $23.7 \%$ | $12.9 \%$ | $10.8 \%$ | $20.4 \%$ |
| L 1 | $3.9 \%$ | $62.7 \%$ | $15.7 \%$ | $4.5 \%$ | $13.2 \%$ |
| L 2 | $2.8 \%$ | $20.2 \%$ | $60.7 \%$ | $9.0 \%$ | $7.4 \%$ |
| L 3 | $7.6 \%$ | $18.9 \%$ | $29.5 \%$ | $19.7 \%$ | $24.2 \%$ |
| $\mathrm{~L} 4+$ | $4.1 \%$ | $16.1 \%$ | $7.0 \%$ | $7.0 \%$ | $65.8 \%$ |

L3's randomize over undominated strategies?

## Results

Quiz scores vs. levels

## Quiz Scores

## Quizzes vs. Quizzes

| Correlation | IQ | Eye Gaze | Memory | CRT+TO |
| ---: | ---: | ---: | ---: | ---: |
| IQ |  | -0.016 | $\mathbf{0 . 1 9 8}$ | $\mathbf{0 . 1 8 2}$ |
| Eye Gaze |  |  | 0.015 | -0.059 |
| Memory |  |  |  | 0.101 |
| CRT+TO |  |  |  |  |
| $p$-values | IQ | Eye Gaze | Memory | CRT+TO |
| IQ |  | 0.849 | $\mathbf{0 . 0 1 9}$ | $\mathbf{0 . 0 3 1}$ |
| Eye Gaze |  |  | 0.862 | 0.489 |
| Memory |  |  |  | 0.233 |
| CRT+TO |  |  |  |  |

## Total Quiz Score vs. Earnings

Correlation: $0.154 p$-value: 0.070

## Quizzes vs. Median Levels

Memory

## Quizzes vs. Median Levels

Which quizzes predict the median level?
MedianLevel $=\beta_{0}+\beta_{1} \mathrm{~S}_{\mathrm{IQ}}+\beta_{2} \mathrm{~S}_{\text {EyeGaze }}+\beta_{3} \mathrm{~S}_{\text {Memory }}+\beta_{4} \mathrm{~S}_{\mathrm{CRT}+\mathrm{TO}}$

|  | Const. | IQ | EyeGaze | Memory | CRT+TO |
| ---: | ---: | ---: | ---: | ---: | ---: |
| Est. | 1.585 | -0.057 | 0.086 | 0.021 | 0.018 |
| $p$-val. | 0.018 | 0.228 | 0.065 | 0.299 | 0.305 |

## Higher Level = Smarter?

Should you play a high level?

## Quizzes \& Level 1

Which quizzes predict Level 1 play?

$$
\operatorname{Pr}\left(\mathrm{L} 1_{\geq 3}\right)=\phi\left(\beta_{0}+\beta_{1} \mathrm{~S}_{\mathrm{IQ}}+\beta_{2} \mathrm{~S}_{\mathrm{EyeGaze}}+\beta_{3} \mathrm{~S}_{\text {Memory }}+\beta_{4} \mathrm{~S}_{\mathrm{CRT}+\mathrm{TO}}\right)
$$

|  | Const. | IQ | EyeGaze | Memory | CRT+TO |
| ---: | ---: | ---: | ---: | ---: | ---: |
| Est. | 1.307 | 0.152 | $\mathbf{- 0 . 2 7 6}$ | $\mathbf{- 0 . 1 7 1}$ | -0.124 |
| $p$-val. | 0.429 | 0.379 | $\mathbf{0 . 0 2 3}$ | $\mathbf{0 . 0 3 6}$ | 0.151 |

## Quizzes \& Higher Levels

But quizzes don't predict L2 or L4+...

| L2 | Const. | IQ | EyeGaze | Memory | CRT+TO |
| ---: | ---: | ---: | ---: | ---: | ---: |
| Est. | -3.169 | -0.052 | 0.153 | 0.091 | 0.062 |
| $p$-val. | 0.080 | 0.770 | 0.276 | 0.383 | 0.433 |

| L4+ | Const. | IQ | EyeGaze | Memory | CRT+TO |
| ---: | ---: | ---: | ---: | ---: | ---: |
| Est. | -2.849 | -0.114 | 0.229 | -0.006 | 0.018 |
| $p$-val. | 0.121 | 0.526 | 0.138 | 0.949 | 0.837 |

## Decision Time vs. Level

We monitor how long players take to click 'OK'...
Time $_{i g}=\beta_{0}+\beta_{1} \mathrm{I}\left(L 1_{i g}\right)+\beta_{2} \mathrm{I}\left(L 2_{i g}\right)+\beta_{3} \mathrm{I}\left(L 3_{i g}\right)+\beta_{4} \mathrm{I}\left(L 4_{i g}\right)+\varepsilon_{i g}$

|  | $\beta_{0}$ | $\beta_{1}$ | $\beta_{2}$ | $\beta_{3}$ | $\beta_{4}$ |
| ---: | ---: | ---: | ---: | ---: | ---: |
| Est. | 88.86 | -8.33 | -1.24 | -3.15 | -7.82 |
| $p$-val. | 0.000 | 0.194 | 0.450 | 0.392 | 0.212 |

Note: omitted dummy is 'dominated strategy'

## Results

Levels vs. Different Opponents

## Level Distributions by Opponent

## Level Distributions by Opponent

K-S tests for differences of distributions:

| $p$-Values | vs. Low | vs. Random | vs. High |
| ---: | :---: | :---: | :---: |
| vs. Low |  | 0.348 | $<\mathbf{0 . 0 0 1}$ |
| vs. Random |  |  | $\mathbf{0 . 0 4 3 2}$ |
| vs. High |  |  |  |

Players play differently against high-scoring opponents.

## Moving Up or Down

When moving from Situation A to Situation B, we say you move up in level if
(1) min level in $B \geq$ max level in $A$, and
(2) levels in $B \neq$ levels in $A$.

Fraction of subjects moving up:

| From $\downarrow$ To $\rightarrow$ | vs. Low | vs. Random | vs. High |
| ---: | ---: | ---: | ---: |
| vs. Low | - | $11.43 \%$ | $20.71 \%$ |
| vs. Random | $7.14 \%$ | - | $16.43 \%$ |
| vs. High | $4.29 \%$ | $7.14 \%$ | - |

## Results

Model Comparison

## Model Comparisons

Estimate fit of The Big Three models:

| $\mathrm{N}=560$ | Level $-k$ | QRE | Nash + Noise |
| ---: | ---: | ---: | ---: |
| $\lambda$ | 0.47 | 0.49 | 0.084 |
| LL | -952.39 | -987.19 | -1159.6 |
| BIC | 1930.092 | 1980.708 | 2325.528 |
| L1 | $52 \%$ | $17 \%$ | $0 \%$ |
| L2 | $15 \%$ | $22 \%$ | $0 \%$ |
| L3 | $11 \%$ | $13 \%$ | $0 \%$ |
| Nash | $22 \%$ | $29 \%$ | $100 \%$ |

QRE consistently predicts more L2 than L1 here...

## UG Conclusions

(1) Level distributions are fairly stable, similar to old data
(2) L1, L2, and L4/Nash are quite stable types
(3) Eye Gaze + Memory quizzes may be useful in predicting types
(4) Players react to expectations about opponents

- 'Opponents' should be part of the description of the game
(5) Level- $k$ fits best of $1^{\text {st }}$-generation models

## A Second Family of Games

- How stable are levels moving to a 'similar' family of games?
- Do our results translate to other games?

Costa-Gomes \& Crawford 2006 AER: 2-Person Guessing Games

|  | Lower Limit | Upper Limit | Target |
| :---: | :---: | :---: | :---: |
| Your Parameters | 215 | 815 | 1.40 |
| Other's Parameters | 0 | 650 | 0.90 |

34 subjects, 6 plays ( 3 games, 2 roles each)
2 games from CGC06, 1 new game

## 2PGG

|  | Lower Limit | Upper Limit | Target |
| :---: | :---: | :---: | :---: |
| Your Parameters | 215 | 815 | 1.40 |
| Other's Parameters | 0 | 650 | 0.90 |

- L0: $1.4(650-0) / 2=455$ (Other: 463.5 )
- L1: $1.4(463.5)=649$ (Other: 409.5)
- L2: $1.4(409.5)=573$ (Other: 584)
- L3: $1.4(584.01)=818 \rightarrow 815$ (Other: 516 )
- Nash: 815 (Other: 650)

## Action Distributions

## Level Distribution

Nash play and L2/L1 much lower. More L1. Similar to CGC06.

## Switching

Randomly draw 2 players, one UG, and one 2PGG.

| Event | Probability |
| ---: | :---: |
| Neither changes level: | $4.64 \%$ |
| Only one changes level: | $33.9 \%$ |
| Both change in same direction: | $34.4 \%$ |
| Both change i opposite directions: | $27.1 \%$ |

## Conclusions

(1) Level- $k$ model reasonably stable within very similar games
(2) Across different games stability is weak
(3) Definite heterogeneity
(4) 'Rules of thumb'
(5) Ability to predict behavior?

## Future: Dynamics

THE END
